Background

Trapnell C, Hendrickson DG, Sauvageau M, Goff L et al. "Differential analysis of gene regulation at transcript resolution with RNA-seq". Nat Biotechnol 2013 Jan;31(1):46-53. PMID: 23222703

The authors report an differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1.

Volcano Plot

Let's make a volcano plot.

```
plot(res$log2FoldChange, -log(res$padj))
```

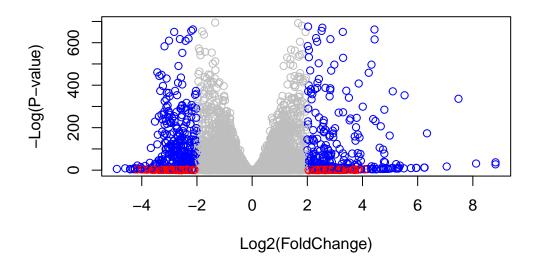

I can improve this plot by the below code, which adds color and axis labels.

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res))

# Color red the genes with absolute fold change above 2
mycols[abs(res$log2FoldChange)>2] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- ((res$pvalue)<0.01) & (abs(res$log2FoldChange)>2)
mycols[inds] <- "blue"

plot(res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(FoldChange)"</pre>
```

Adding gene annotation

I can use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by the code below.

```
